Overview	Land is one of the hardest assets to trust from a distance. Owners — especially those living outside the country — often can't tell if their title is clean, what the land is legally allowed to become, or whether the person advising them locally is reliable. We set out to replace that uncertainty with a single system: upload documents, get a clear read on the asset, see what it could become, and hand execution to vetted partners.
My Role	Product Designer (AI workflows). I designed the core investor-facing flows — intake, document review, the HABU strategy engine — and worked with one collaborator across a 3-month, 2-person build.
Status	Pre-launch. Core flows are designed and in front-end build. No users have touched this yet, so nothing in this case study is a shipped result — only a decision, and the reasoning behind it.

DISCOVERY

Land You Can't See Is Land You Can't Trust

What owners are dealing with	Multi-crore land, zero local visibility. Verifying a title today means chasing lawyers, surveyors, and brokers by hand, over months.
What I was actually designing for	Not a listings site — a trust problem. The product had to make someone feel like they suddenly had an expert standing on land they'd never seen.

Four People, One Shared Truth

Intent before documents

Onboarding opens with strategy questions, not uploads. Documents are the highest-trust-cost step, so they come after the product has already shown it understands the user.

A queue, not a marketplace

For providers claiming cases, I treated it as a race-condition problem first, a UI problem second. First-come-first-serve had to feel instant and unambiguous — a provider opening an already-claimed case is a trust failure, not a bug.

Show the report, hide the density

The HABU strategy engine returns three ranked options as scannable cards — ROI, capital, timeline, risk — with full depth one click away. Legal metadata stays in accordions so the main view never overwhelms.

Name the humans, not just the bar

Once a case is in execution, the detail view names the actual project manager, architect, and legal counsel assigned — not an abstract percentage.

Execution detail — named people, not just a percentage

Project manager, architect, and legal counsel are named and status-tracked once a case moves into execution.

WHERE IT STANDS

No Results Yet — Just the Reasoning

Unlike a shipped product, there's no before/after here. What I can show is what's built, what's not, and what's still unresolved.

● Built	Onboarding, document intake, portfolio dashboard, HABU report, provider claim flow
● In progress	Mobile web, the case-status engine
● Unresolved	Whether investors and providers message directly, or route everything through a relationship manager

REFLECTION

What I'd Watch For Next

Untested assumptions are still assumptions	Every decision here is my best read of the trust problem, not a validated one. The first thing I'd want post-launch is real usage data on the HABU report — it's the riskiest surface in the product.
Four personas is a tax on simplicity	Every screen had to answer: does this still make sense for a relationship manager, not just an investor? That constraint slowed me down more than any technical one.
